► **COMPANY HISTORY**

- 1985** Italian cycling trading company Brewo Italia, owned by **Max Brauns**, begins selling and servicing many Italian cycling component brands, including Clément brand of tires, worldwide.
- 1990** Italian tubular tire brands Vittoria and Clément move to Thailand.
- 1998** The factory supplying Brewo tubular tires in Thailand closes.
- 1999** Max Brauns goes to Thailand to buy and re-construct the tubular factory machinery so that he can continue supplying his valued customers worldwide.
- 2003** After failing to reach a licensing agreement with Pirelli for use of the Clément trademark, Max and his son Alessandro, create their own brand Challenge to produce and sell tubulars and open tubulars.
- 2005** Original molds for the world famous Grifo (Cyclocross), Criterium and Paris-Roubaix (Road), Crono (TT) and Pista (Track) are joined by new, innovative tread designs like Grifo XS (Cyclocross) and Strada (Road). Liberty-Seguros Pro Cycling Team races on Challenge tubulars.
- 2006** Challenge creates an innovative process to produce the world's first **seamless latex inner tube**. Erwin Verweken wins the Cyclocross World Championships on Challenge.
- 2007** Challenge introduces the **Forte** (Road) and **Triathlon** (TT/Triathlon) tires. Erwin Verweken wins the Cyclocross World Championships on Challenge.
- 2008** Challenge introduces the **Fango** cyclocross tire.
- 2009** Challenge focuses on expanding Open Tubular range by releasing Forte, Triathlon and Fango with Open Tubular construction making these elite level clinchers more available.
- 2010** Paris Roubaix Open Tubular introduced. Zdenek Štybar wins the Cyclocross World Championships on Challenge.
- 2011** Challenge introduces the aggressive **Limus** cyclocross tire. RadioShack Pro Cycling Team races on Challenge tires.
- 2012** Challenge creates the first tire specifically for racing on dirt roads, **Strada Bianca**, named after the famous white roads of Tuscany. Challenge also introduces their first MTB tubular, MTB One. Following the passing of company patriarch **Max Brauns**, **Alex Brauns** and his sister, **Simona**, take over the full running of the factory and office.
- 2013** Challenge develops the double Puncture Protection System (PPS2) technology and introduces second Gravel racing tire, Almanzo, named after and licensed by the famous Minnesota 100 mile race. Challenge celebrates the crowning of five U.S. National Champions in five different cycling disciplines in the same year – Road, TT, Cyclocross, Triathlon and Criterium.
- 2014** Challenge introduces the fast rolling **Chicane** cyclocross tire and makes the 320TPI Corespun Cotton casing **Team Edition** Grifo and Limus tires available to the public.
- 2015** Challenge adds the **Chicane** and all new **Baby Limus** “Sticky mud” tire to the Team Edition racing range, three new 25mm tires to the Road range and the **Gravel Grinder** to the Gravel Range.

► **PRODUCTS**

Challenge produces performance tubular and open tubular tires by hand in the Challenge Tech factory in Thailand, combining supple natural-rubber treads, the highest-quality Silk, Cotton and Polyester casings and the world's first seamless Latex inner tube. Producing tires of this quality requires a unique artisan production process that uses advanced materials and technology, while referring to craftsmanship developed over the past 100 years.

Non-vulcanized natural rubber treads provide the best traction and braking and the most secure cornering available. Silk casings provide the highest ride quality, thanks to an unmeasurably high thread count. The fine, tightly woven Silk filaments produce a thin, pliable, extremely strong fabric. Corespun Cotton casings are the favorites of world-class athletes because they are light and supple with thread counts up to 320TPI for maximum comfort, control and performance. SuperPoly and Polyester casings are less expensive and more durable, while still offering the performance features of a top-end tubular.

▶ **HANDMADE PRODUCTION**

Every Challenge tubular and open tubular is produced by hand. This handmade process minimizes the use of heat treatments and specifically avoids the industry-standard extreme heat treatment called vulcanization. By resisting these common practices, Challenge is able to provide the ultimate quality standard in high-performance products.

Our handmade production allows our treads, casings and inner tubes to maintain their original suppleness and flexibility, achieving the best grip for controlled cornering, rapid accelerations and flat-out speed. A supple Challenge tire is able to absorb and reduce harmful vibrations passing from the road to the body, normally produced by riding stiffer vulcanized tires, ultimately reducing muscle stiffness, inflammation and fatigue.

▶ **PPS Puncture Protection Strip**

The Puncture Protection Strip is a special aramid fabric placed between a tire's tread and casing to increase resistance to punctures. Some tires designed for use on rough roads, cobbles and gravel receive PPS2, an additional layer of PPS between the casing and the inner tube.

▶ **SEAMLESS LATEX INNER TUBE**

Challenge sources high-grade natural Latex to produce the only seamless Latex inner tube on the market. Due to the lack of seams, these tubes have no bumps or added weight that commonly cause a tire to feel out of round. This also improves the overall strength of the tubes as seams are commonly the weak point on an inner tube.

Latex inner tubes are also very elastic, allowing them to initially wrap around a foreign object, rather than immediately puncturing.

Warning: because of its elasticity, installation of a Latex tube requires the skills of an experienced hand. Latex tubes can be more prone to pinch flats if not installed properly.

▶ **SILK Best of the Best**

Silk, like Cotton, is a natural fiber. While Cotton has the advantage of being less expensive, it unfortunately tends to absorb moisture and degrades if not properly cared for. Silk does not absorb water, has finer threads and can be woven at such a high thread count that it is almost impossible to count. Silk casings are more supple and provide lower rolling resistance, as well as being more resistant to cuts and more durable than Cotton. Challenge offers Silk casing for track, road and cyclocross tires.

Silk is unfortunately very expensive and top-quality grades of Silk are not easily sourced. This is why Challenge uses Silk in only the highest-performance tires for the most demanding cyclists in the most important events. It is not a surprise that Silk is mostly used for the highest speeds on the track.

► TPI (THREADS PER INCH)

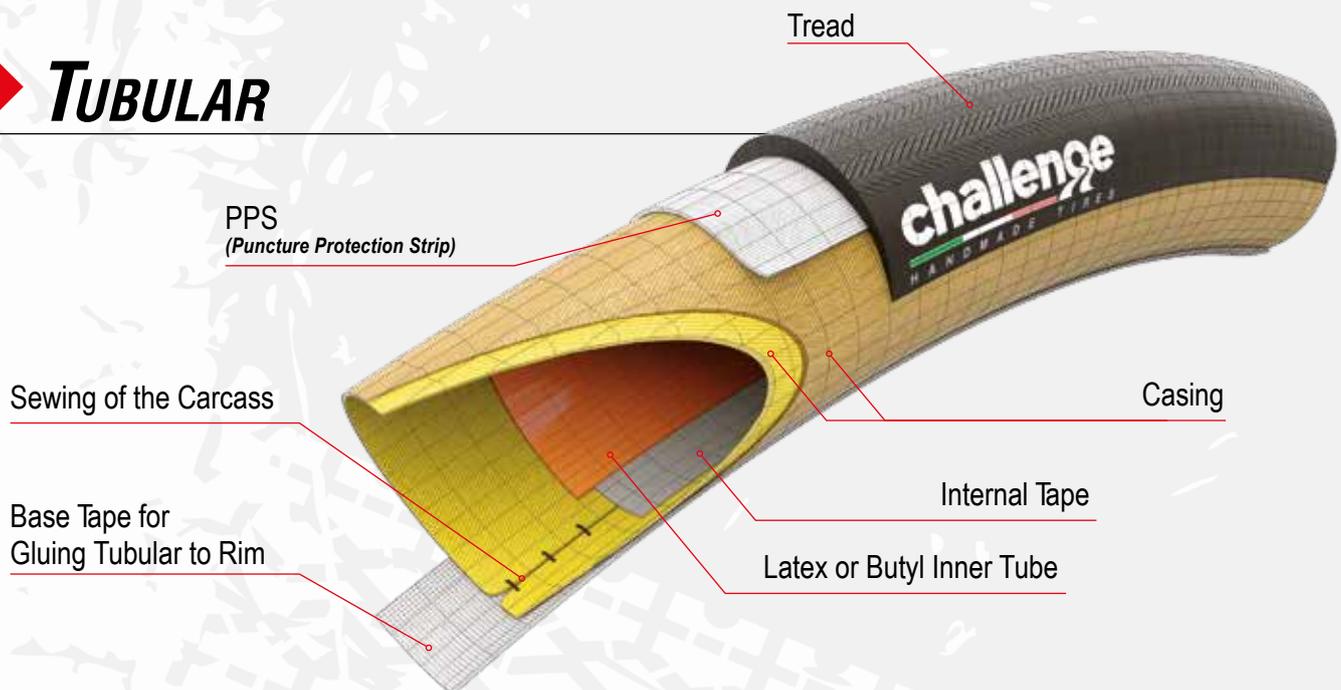

The density of the casing fabric is expressed in TPI (Threads Per Inch). The TPI is traditionally used as a parameter to determine the quality of a tire. In principle, the higher the thread count, the better the quality of the tire.

Larger threads weigh more and require large amounts of adhesive to bind them together when producing the casing fabric. This results in a heavier, stiffer fabric which translates into a slower tire. Challenge's casings are more refined, weaving much thinner materials such as Polyester, Cotton and Silk, into higher density, finer quality casings. Challenge is one of the very few manufacturers capable of offering casings with thread counts above 220TPI. Compared to lower thread count nylon fabrics, a finely woven Polyester, Cotton or Silk fabric will weigh less while providing casings that are more

supple and that better hug the ground. This improves comfort and handling while reducing rolling resistance. Challenge's handmade tires are available in SuperPoly, Corespun Cotton or Silk. SuperPoly casings are the least delicate and range from 220 to 300TPI. Corespun Cotton casings start at 320TPI and provide a lighter, more supple tire. Our lightest casings are made from Silk with a thread volume too high to count.

Warning: Some manufacturers falsely market tires with high thread counts by counting each layer of casing when formulating the number. For instance, some brands boast a 330TPI casing when that casing is really three layers of 110TPI nylon. This results in a heavier, stiffer, and slower tire than a Challenge model with 320TPI per layer.

► TUBULAR

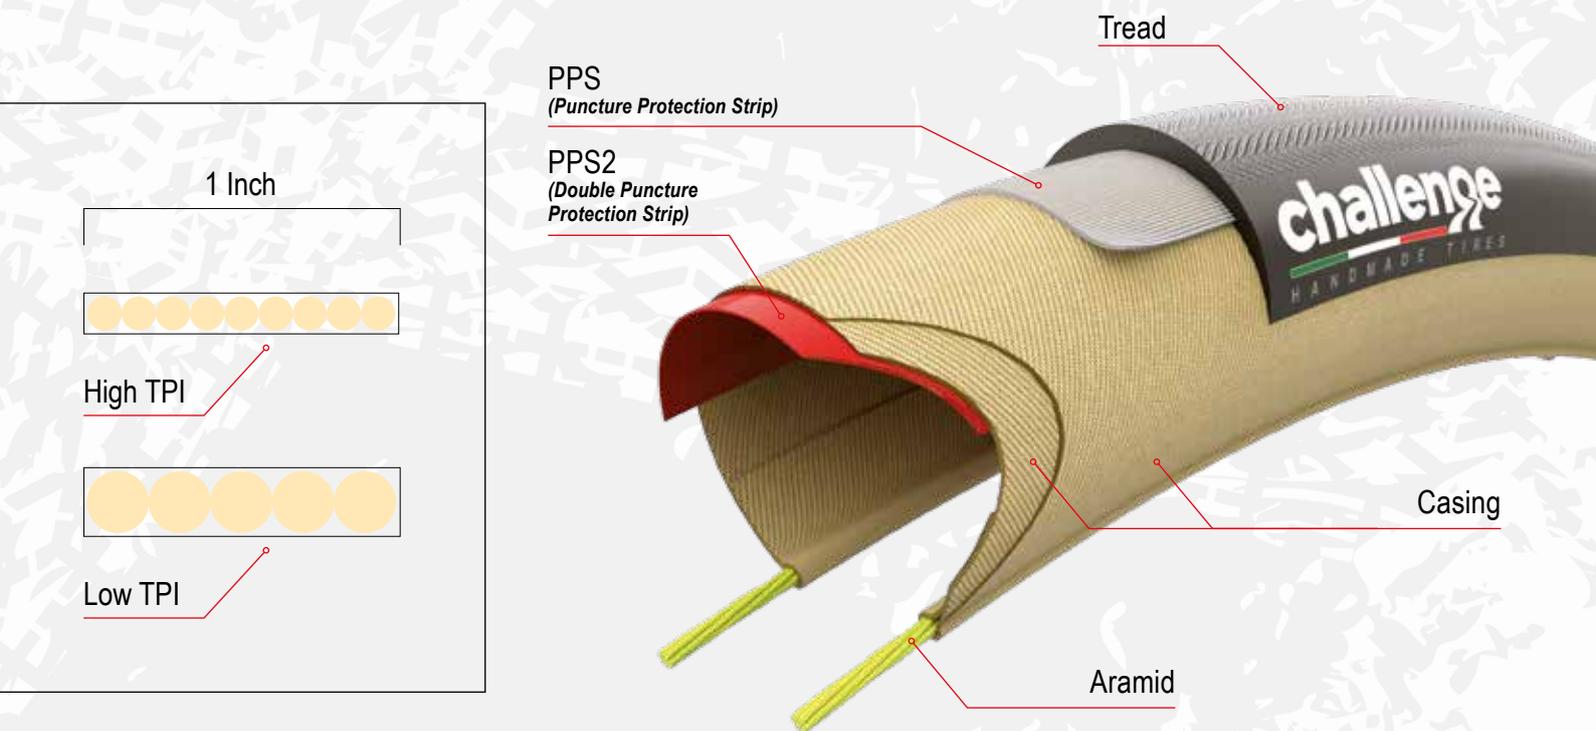

The highest performance tubulars begin with Challenge's high thread count casings. These are sewn into a carcass with a seamless Latex inner tube inside. This structure is then mounted on tubular rims and inflated. Skilled craftsmen hand-glue natural (non-petroleum based) rubber treads onto the inflated carcass. This process allows the tread to take the shape of the inflated tire, preventing tension between the tread and carcass and retaining ideal flexibility.

The combination of this process with high thread-count casings and Latex tubes results in tires with lower rolling

resistance and increased comfort offering a safer and more precise handling of the bike. These tires absorb irregularities in the road surface with their subtle give and slight deformation, increasing surface contact and guaranteeing both shock absorption and great grip while cornering.

During this process, tubulars receive base tape, applied over the stitches to protect them from the glue used to attach these tires to tubular rims and some have a PPS (Puncture Protection Strip) between the treads and the casing in order to increase puncture resistance.

▶ OPEN TUBULAR

An open tubular is constructed using the same casing and tread materials and process as a tubular, but instead of sewing the casing together (closed), the sides of the tubular casing are folded around aramid fiber cords to produce beads. This 'open' design performs like a tubular, yet conveniently mounts like a standard clincher tire. If combined with a Latex inner tube the ride becomes even closer to that of a tubular, offering excellent traction and cornering, low rolling resistance and shock absorption.

CHALLENGE OPEN TUBULAR VS. TRADITIONAL CLINCHER	
OPEN TUBULAR	TRADITIONAL CLINCHER
Top quality, high-TPI casing materials and natural rubbers	Low-TPI casing materials that use thicker threads and bulkier rubber
Handmade construction provides a laterally flat tire that requires a tube and rim to take round shape	Vulcanized construction provides a rigid, pre-formed U-shaped tire
The highly supple tires translate more energy into forward progress	Absorbs energy in the stiff rubber, which is resistant to deforming, shock passes thru wheel & frame to rider
Conforms easily to the terrain, absorbing and softly rolling over road imperfections and transmitting less shock to the rider	Stiffer so it bounces when rolling over imperfections in the terrain and provides a harder feel that passes more road shock up to the rider
The softer natural rubber tread will grip road imperfections resulting in controlled cornering in wet or dry conditions	The stiffer rubber tends to corner poorly, as it bounces more and does not grip imperfections in the road
Softer, natural rubbers tend to wear faster than stiffer, vulcanized rubber	Vulcanized rubber is more durable providing longer tread life

▲ **WARNING**

Tire and Rim Compatibility

Tire manufacturers, including Challenge, recognize that new clincher rim designs are being introduced, or modified, to accommodate carbon fiber hook beads, wider profiles and tubeless technologies that may not respect internationally accepted standards. Challenge open tubular and vulcanized clincher tires are designed to meet ETRTO (European Tire and Rim Technical Organization) standards for both clincher hook bead shapes and the tire/rim size compatibility as listed in the chart above. Use of Challenge tires on rims that do not meet these standards, as well as use without a tube, could result in severe injury and is solely the responsibility of the assembling party.

Challenge open tubular and vulcanized clincher tires display sizes on the sidewall that are based on ETRTO standards describing the tire width (mm) x tire rim diameter (mm). They also include a "C" for Crotchet (meaning hook in English). Therefore, a tire like the Strada, will include the size 25c-622 which means the tire is 25mm wide and is intended for a 622 bead seat diameter rim with hook bead edges.

ATTENTION!

Tire Pressure

Tire pressure directly influences the comfort, handling, durability and rolling resistance of a bicycle. For example testing has proven that a properly designed and inflated tire provides 20 times more compliance (shock absorption) than a carbon fiber frame, fork and wheel set combined. This tire shock absorption is critical to a safe, enjoyable ride over any distance.

A tire can only operate to its full potential when properly inflated. Each Challenge tire includes an air pressure range. If the air pressure is too low, the risk of punctures, loss of traction and wear increases. A tire that is inflated too high stiffens the ride which adversely affects traction, cornering grip and rolling resistance. Always inflate and maintain tire pressures in the specified range. Please see the Challenge website www.challenge.tech.it for more specific pressure recommendations based on rider weight, terrain and conditions.

All bicycle tires continually lose pressure and top-level handmade tires may lose air pressure faster than vulcanized clinchers due to the soft supple materials used in their construction being more permeable. For this reason you should check and adjust your tire pressure before each ride.

ATTENTION!

Weight

Challenge's goal is to provide light, durable tires. Occasionally there are small deviations from the weight listed in our catalog. These variations result from tolerances in the tread thickness and other rubberized material that cannot be avoided in the handwork of the manufacturing process. The weight information in the catalog is based on the target weights that were determined in pre-production and during repeated measurements made during production. Deviations of up to 10% of the target weights are possible according to our design tolerances.
